

# Rating Constitution

Welcome everyone!

# Rating Constitution

Very Resilient

Resilient

Moderately Resilient

Least Resilient

**Density** = Resistance or resilience. Refers to the body's ability to resist disease or dis-ease as Dr. Jensen used to explain it.

Very Resilient

Resilient

Moderately Resilient

Least Resilient

**Iris fiber density is an indication of the structural integrity of the body. Density in iridology is related to the closeness and depth of the weave of the iris fibers or trabeculae within the iris stroma.**

**Resilience** refers to the body's ability to resist disease or to bounce back quickly from illness. Density and shading work together to help determine the true nature of the genetically deficient areas in a person's body.

Shading – From Light to Dark

1. White or Light Iris Fibers
2. Light Gray Fibers
3. Dark Gray Fibers
4. Black Fibers

Shading = Reaction: The body's ability to react to illness

**White or Light Iris Fibers** that are raised signify potential agitation, irritation, inflammation, possible pain or discharge to the organs represented by the reaction fields of the iris that these signs are found in.

**Light Gray Fibers** that are slightly lower than the stromal surface indicate a tendency for sluggishness and a lowered ability to ward off illness in the organs represented by the iris fields they are in.

**Dark Gray Fibers** that are deeper than the light gray fibers show potential deficiency, lack of ability to hold in nutrients and throw off toxicity.

**Black Fiber Areas** in the iris show the greatest genetic weakness or insufficiency in those organ areas that they represent in the body. These organs may not cause difficulty until later in life. Measures of prevention should be considered particularly if there has been much physical abuse as they are believed to be predictors of serious illnesses.

**Density and Shading** work together to help determine the true nature of the genetically deficient areas in a person's body.
