

Concepts & Common Terminology to Master

Biocommunication

In the context of ZYTO Technology, biocommunication consists of an exchange of information between a computer and the body through galvanic skin response (GSR). The ZYTO Hand Cradle measures GSR and the software ranks the changes in energetic coherence and generates reports.

Biological or Energetic Coherence

A state in the body where two or more things exist without conflict. By introducing digital signals of actual items, ZYTO decision-support technology can detect and rank changes. Reports generated from this information act as guides in making decisions about personal wellness. Biological coherence is also referred to as biological preference.

Galvanic Skin Response

A method of measuring fluctuations in the electrical conductivity of the skin.

Virtual Item

A digital signature representing an item. Think of a Virtual Item as a “question” posed to the body about a particular item, such as a supplement or clinic service. The response to this question is the change in the electrical properties of the skin, which is measured by the Hand Cradle.

VSIs are created using a proprietary formula in the ZYTO software. They generate a signature, or signal representing the item they have been linked to. When this signal is presented to the patient during the scanning process, the response that is generated is like a response you would get if you had the actual item present and used it to stimulate a response. The reason they are called VSIs (Virtual Stimulus Items) is because they virtually represent the item they are linked to; they are not the item.

Stressor Virtual Item

An item run as a stressor in a scan that represents a biomarker or an external item. Both positive and negative responses to stressor Virtual Items are considered when examining what to use as balancer Virtual Items.

Biomarkers

A subset of stressor Virtual Items that represent various body parts and functions, such as organs, glands, and systems.

Balancer Virtual Items

Items run as balancers during a scan that represent various products or services. Any positive in- or out-of-range items can be considered to use as balancer Virtual Items.

Deviation Ratio (dR)

A numerical expression of coherence with a specific Virtual Item. A positive dR indicates an increase in coherence, while a negative dR indicates diminishing coherence.

Biosurvey

A survey that identifies the body's biological coherence for a chosen group of Virtual Items. The results from a Biosurvey can help you and your client make better decisions about their wellness.

Range

The range is determined by measuring the responses to 35 neutral Virtual Items at the beginning of every ZYTO scan. The range is the body's normal response level. Anything in range may be considered a stressor Virtual Item the body may be able to handle on its own. The out-of-range stressor Virtual Items are the items that the body had an unusual response to and might need some help to bring back into range.

Non-Response or 0.0 dR Response

Generally interpreted as an "Exhausted" or that the biomarker was too weak to show a response. It would be treated/viewed the same as an "Out of Range" item. In rare cases, practitioners may interpret a zero dR or non-response as showing that the biomarker is in balance.

Dynamic Baseline

A real-time measurement of the body's energetic posture. Because the body's energy constantly fluctuates, this measurement is calculated with each Virtual Item and its corresponding dR.

Vectors and Vectors Tab

Shows energetic relationships between items in the body.
